

## IN THE CLAIMS

1. (original) A transducer element for a torque or force transducer comprising a member having a structure which extends generally radially of an axis to transmit a stress between a radially inner region of the structure and a radially outer region, and at least one region of permanent magnetisation disposed between said inner and outer regions to be responsive to the transmitted stress and emanate a stress-dependent magnetic field.

2. (original) A transducer element as claimed in claim 1 in which there are two magnetised regions, a radially inner region and a radially outer region between which a stress-dependent field is established.

3. (Previously Amended) A transducer element as claimed in claim 1 in which the or each region of permanent magnetisation is arcuate with respect to said axis.

4. (Previously Amended) A transducer element as claimed in claim 1 in which the or each region of permanent magnetisation is an interrupted annulus.

5. (Previously Amended) A transducer element as claimed in claim 1 in which the or each region of permanent magnetisation is annular.

6. (Previously Amended) A transducer element as claimed in claim 1 in which said structure has a generally radially extending surface to which the or each magnetised region extends.

7. (currently amended) A transducer element as claimed in claim 1 in which said member has a generally disc [[-like]] structure.

8. (Previously Amended) A transducer element as claimed in claim 1 in which there are two regions of permanent magnetisation; each being magnetised in an axial direction and the polarities of magnetisation of the two regions being opposite.

9. (Previously Amended) A transducer element as claimed in claim 7 in which said structure has two radially-extending surfaces to which the or each region of permanent magnetisation extends and further comprising means located at one of said two surfaces to close a flux path between the two regions.

10. (Previously Amended) A transducer element as claimed in claim 1 in which there are two regions of permanent magnetisation providing radially-spaced magnetic poles of opposite polarity at a surface of the member.

11. (currently amended) A transducer element as claimed in claim 9 in which said member is formed of a material, said transducer element having a flux path linking said regions, [[is]] said flux path being closed within the material of said member.

12. (Previously Amended) A transducer element as claimed in claim 1 in which there are two regions of permanent magnetisation, each being circumferentially magnetised and the polarities of circumferential magnetisation of the two regions being opposite.

13. (Previously Amended) A transducer element as claimed in claim 1 in which there is a single region of permanent magnetisation which extends obliquely to said axis.

14. (currently amended) A transducer element as claimed in claim 13 in which said structure is generally disc [[disc-like]] and includes a step portion in which said single region is provided.

15. (Previously Amended) A stress sensing transducer system comprising a transducer element which is as claimed in claim 1 and which is subject to stress generated between said radially inner and outer regions of said structure through said at least one magnetised region to emanate a torque-dependent magnetic field, and a sensor system comprising one or more magnetic field sensors

responsive to said stress-dependent magnetic field to provide a signal representing the stress generated between one and the other of said radially inner and outer regions.

16. (Previously Amended) A torque sensing transducer system comprising a transducer element which is as claimed in claim 1 and which has a torque transmission path extending from one to the other of said radially inner and outer regions of said structure through said at least one magnetised region to emanate a torque-dependent magnetic field, and a sensor system comprising one or more magnetic field sensors responsive to said stress-dependent magnetic field to provide a signal representing the stress transmitted between one and the other of said radially inner and outer regions.

17. (original) A transducer as claimed in claim 16 in which said member is adapted as a torque transmitting part capable of transmitting a rotational drive applied to said inner region of said structure to a load applied to said outer region thereof or vice versa.

18. (Previously Amended) A transducer as claimed in claim 15 in which said member is disc-shaped.

19. (Previously Amended) A transducer system as claimed in claim 15 in which said one or more magnetic field sensors is disposed and oriented to detect a circumferential magnetic field component and provide a signal representing same.

20. (original) A transducer system as claimed in claim 19 further comprising a magnetic field sensor device disposed and oriented to detect a radial magnetic field component and provide a signal representing same.

21. (original) A transducer system as claimed in claim 20 further comprising signal processing circuitry responsive to said signals representing the circumferential magnetic component

and the radial magnetic field respectively to derive an output signal representing the circumferential magnetic component referred to the radial magnetic field.

22. (currently amended) A torque or force transducer element comprising a member adapted to transmit torque or force applied along, on or about an axis extending through the member to a portion of the member spaced from said axis, or vice versa,

said member having a surface transverse to said axis,

a first, outer, region located between said axis and said portion and extending to said surface;

a second, inner, region located between said axis and said outer region and extending to said surface [[,]] ; and

[[said]] first and second annular region [[s, being]] magnetised with opposite polarity, and cooperating at said surface to generate a magnetic field component which is a function of said torque or force.

23. (original) A transducer element as claimed in claim 22 in which said first and second regions are annular and encircle said axis, or at least one of the annular regions is an interrupted annulus, or said first and second regions are arcuate with respect to said axis.

24. (Previously Amended) A transducer element as claimed in claim 22 in which said first and second regions are both longitudinally magnetised to develop a radial magnetic field component extending therebetween at said surface and a circumferential magnetic field component at said surface that is a function of torque.

25. (Previously Amended) A transducer element as claimed in claim 22 in which said first

and second regions are both circumferentially magnetised to develop a radial magnetic field component at said surface as a function of torque.

26. (currently amended) A torque or force transducer assembly comprising  
first and second members coaxially disposed,  
said first member being of greater diameter than said second member,  
a disc [[-like]] member extending generally radially of said axis and connecting said  
first member to said second member for transmitting force from one member to the other, said disc  
[[[-like]]] member comprising two magnetised [[annular]] regions that are at least arcuate or [[annular  
or are]] part annular,

said magnetised regions having a magnetisation such that the regions cooperate to  
generate a magnetic field component that is a function of a stress established in transmitting a load  
between said first and second members.

27. (original) A transducer assembly as claimed in claim 26 in which said assembly is  
adapted to transmit torque from one of said members to the other.

28. (Previously Amended) A transducer assembly as claimed in claim 26 in which said  
magnetised regions are longitudinally magnetised with opposite polarities or circumferentially  
magnetised with opposite polarities.

29. (currently amended) A transducer assembly as claimed in claim 26 in which said first  
and second members are mounted to cause flexing of said disc [[-like]] member in response to  
relative axial displacement of the first and second members.

30. (currently amended) A transducer assembly as claimed in claim 26 in which said first  
and second members are disposed to cause flexing of said [[dis-like]] disc member in response to

a relative displacement of said first and second members away from axial alignment.
